

The diagram illustrates a communication system. On the left is a mobile device (10) with an antenna (11). On the right is a laptop (12) with a screen (14) and a keyboard (13). A stack of documents (15) is positioned between them. A curved arrow (16) labeled "<command>;<parameters>" indicates data flow from the mobile device to the laptop. A large arrow (17) points towards the mobile device with the text "brought into vicinity". A label (18) is also present near the communication path. The laptop screen (14) displays a menu (19) with options like "file", "edit", "format", "print", "quit", and "back".

FIG. 3

FIG. 4

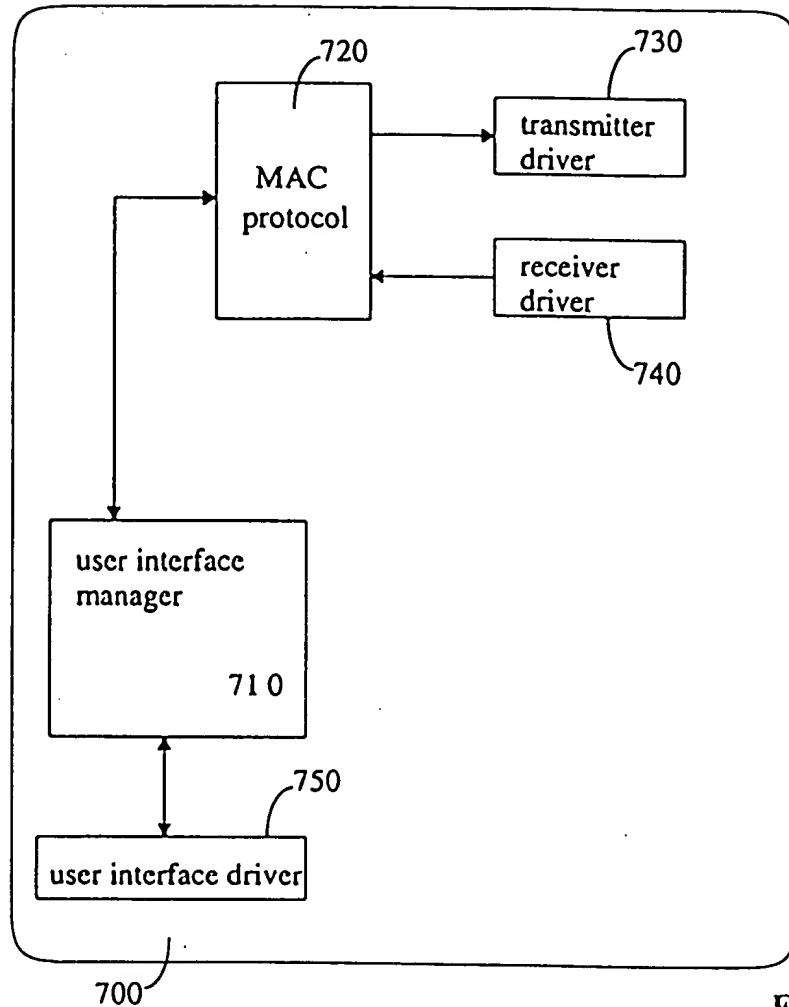

FIG. 5

The flowchart illustrates the background process 84a. It begins with a box labeled "Periodically send service information" (84). An arrow points down to a box labeled "Monitor" (87). From "Monitor" (87), an arrow points down to a box labeled "receive input & categorize cond." (88). From "receive input & categorize cond." (88), three arrows branch out: one labeled "service information" points to a box labeled "update own list with services" (89); one labeled "request to send UI information" points to a box labeled "send UI-description" (85); and one labeled "user input" points to a box labeled "handle/execute user input" (86). From "update own list with services" (89), an arrow points down. From "send UI-description" (85), an arrow points down. From "handle/execute user input" (86), an arrow points down to a box labeled "send feedback" (90). A feedback loop is shown with a dotted arrow labeled "background" (84a) that starts from the "send feedback" (90) box, goes up and left, and then points to the "Periodically send service information" (84) box. Another solid arrow points from the "send feedback" (90) box up and left to the "Monitor" (87) box.
